Apollo ARCSAV Level 0 (Raw Binary) File Processing Programs and Supplementary Input Files

Program ¹	Description	Main Input Files	Supplementary Input Files	Output Files ^{2,3}	Last Revision Date
renamefj.f	Rename JBI files for NSSDCA	e*.tap	filenamecrj.txt	arcsav_ap*_* .P*_j	12/10/15
renamefd.f	Rename DBDS files for NSSDCA	28c1.*.bcd	filenamecrd.txt	arcsav_ap*_* .P*_d*	6/11/16
renamefk.f	Rename KDM files for NSSDCA	*.tap	filenamecrk.txt	arcsav_ap*_* .P*_k	11/19/16
renamefk2.f	Rename KDM files for NSSDCA, v. 2	*.tap	filenamecrk2.txt	arcsav_ap*_* .P*_k	4/30/17
db-to-jbi.2.c	Format conversion from DBDS to JBI	28c1.*.bcd		28c1.*.jbi	3/25/14
kat_to_jbi.c	Format conversion from KDM to JBI	*.tap		*.tap.jbi	11/27/16
renamefdj.f	Rename JBI format DBDS files to NSSDCA	28c1.*.jbi	filenamecrd.txt	arcsav_ap*_* .P*_dj*	6/11/16
renamefkj.f	Rename JBI format KDM files to NSSDCA	*.tap.jbi	filenamecrk.txt	arcsav_ap*_* .P*_kj	11/19/16
renamefkj2.f	Rename JBI format KDM files to NSSDCA, v. 2	*.tap.jbi	filenamecrk2.txt	arcsav_ap*_* .P*_kj	4/30/17

¹ These Fortran (*.f) and C language (*.c) programs are provided by the data provider, Yosio Nakamura, for documentation purposes only. The programs are provided in alphabetical order on pages 2-13 of this document. The Supplementary Input Files used by these programs are listed in alphabetical order on pages 14-24.

² The Output Files named “arcsav_ap*” are the renamed vendor-extracted ARCSAV tape files that are grouped into five Level 0 (raw binary) data collections by Apollo mission and archived at the NASA Space Science Data Coordinated Archive (NSSDCA) under these collection identifiers: PSPG-00912 (Apollo 12); PSPG-00913 (Apollo 14); PSPG-00914 (Apollo 15); PSPG-00915 (Apollo 16); and PSPG-0916 (Apollo 17). The archived file names are cross-referenced to the Input original vendor-based file names in NSSDCA document B56516, <https://nssdc.gsfc.nasa.gov/misc/documents/b56516.pdf>. Level 0 data format is described in NSSDCA document B56515, <https://nssdc.gsfc.nasa.gov/misc/documents/b56515.pdf>.

³ The Output files named “28c1.*.jbi” and “*.tap.jbi” are the files that vendors DBDS and KDM extracted from the ARCSAV tapes. The C-language programs db-to-jbi.2.c and kat_to_jbi.c convert the vendor-specific file formats to the format used by vendor JBI’s format.

db-to-jbi.2.c

```
/*
 * db-to-jbi.c 10/2013 mark wiederspahn
 *
 * v2 3/2014 mw    add record number to unexpected size print
 *                   at last record, also report unexpected size
 *                   check parity, report such each block
 *
 * change format of 7 track decoded files:
 * change databank files to jbi files
 * if sign bit is set, this is the first byte in a record.
 * remember the byte count, and emit that, then the record,
 * then the byte count again, similar to how jbi did it.
 *
 * the byte counts are little endian i*4
 *
 * db-to-jbi < databank-file > jbi-file
 *
 */

```

kat_to_jbi.c

/*
 * kat_to_jbi.c read a Catalyst 7 track tape image and make a JBI tape image,
 *
 * updated 2016/11/27 mw - clarify some descriptions. No code changes.
 *
 * The Catalyst input does not have any parity bits, only low 6 bits.
 * Add parity bits as we go. The two 48byte headers are even parity,
 * all the other data records are odd parity.
 *
 * We assume a little-endian computer; this only affects the 3 header
 * integers.
 *
 * input: repeat forever: (record header,data block)
 * record header: 12 byte header: is_eof, leof, leod all 32 bit little-endian
 * ints:
 *   is_eof is 0 if data follow, 1 if this is an eof. Not sure of leof/leod
 *   values if so.
 *   leof is byte offset of the start of the descriptor for previous record
 *   (0 if beginning)
 *   leod is byte offset of the start of the descriptor for the next record
 *   (0 if end)
 *   we could read this a struct, but it is simple to treat it as 3 4-byte
 *   chunks.
 * data block: tape record, 6 bits in low bits of each byte, top 2 bits 0,
 *   so no parity.
 *
 * output JBI format: byte count before and after each data block (32 bit
 * little endian ints).
 * eof marks are zero byte records. JBI data block includes bit 6 parity,
 * and flags bad hardware detected parity with bit 8 set
 *
 */

```

```
