1. INTRODUCTION:

The documentation for this data set was originally on paper, kept in NSSDC's Data Set Catalogs (DSCs). The paper documentation in the Data Set Catalogs have been made into digital images, and then collected into a single PDF file for each Data Set Catalog. The inventory information in these DSCs is current as of July 1, 2004. This inventory information is now no longer maintained in the DSCs, but is now managed in the inventory part of the NSSDC information system. The information existing in the DSCs is now not needed for locating the data files, but we did not remove that inventory information.

The offline tape datasets have now been migrated from the original magnetic tape to Archival Information Packages (AIP's).

A prior restoration may have been done on data sets, if a requestor of this data set has questions; they should send an inquiry to the request office to see if additional information exists.

2. ERRATA/CHANGE LOG:

NOTE: Changes are made in a text box, and will show up that way when displayed on screen with a PDF reader.

When printing, special settings may be required to make the text box appear on the printed output.

Dear Mr. Vostreys:

Per our recent telephone conversation, I am mailing, herewith,
the following items:

1. one magnetic tape #T01651 containing Apollo laser altimeter incidence points and associated data from Missions 15 and 17,
2. a decimal dump of tape #T01651,
3. tape format information,
4. a brief description of the data on #T01651.

As I indicated during our discussion, I shall mail a copy of our final report which is now being prepared (it should be in your hands within a month).

Should there be questions or comments, please contact me.

Sincerely yours,

John L. Jenkins

Description of Apollo Laser Incidence
Coordinates' Determination

Missions 15, 16, and 17 carried an advanced mapping system which included

1. A laser altimeter to make discrete measurements of slant range from the Command Module (CM) to some point on the lunar surface. The distance measurements were good to ± 2 M.
2. A stellar camera which photographed stars simultaneous to the laser firings (± 0.001 sec timing tolerance); from which the laser firing direction could be deduced.
3. A metric mapping camera which took photographs of the lunar surface simultaneously with laser firings and exposure of the stellar camera.
4. A panoramic camera which took wide-angle photographs of the lunar surface.

The laser was fired in two modes; on the lighted side of the moon simultaneous with the mapping, panoramic and stellar camera exposures, and on the dark side with only the stellar camera operating. Given position estimates of the CM at laser firings, it is a straightforward calculation to determine laser incidence coordinates. CM position estimates were originally taken from NASA-determined orbit estimates using Doppler tracking. These estimates were refined using short-arc orbit fits to photogrammetric-determined CM positions at mapping camera exposure times. Various empirical processes were developed to compensate for the uncertainty introduced by unmodeled accelerations (gravity anomalies and vehicle process noise). The reductions include formal covariances propagations which are believed to provide reasonable uncertainty estimates for the determined coordinates. The details of our reduction processes are being documented in the final report on NASA contract NAS9-12752.
