1. INTRODUCTION:

The documentation for this data set was originally on paper, kept in NSSDC's Data Set Catalogs (DSCs). The paper documentation in the Data Set Catalogs have been made into digital images, and then collected into a single PDF file for each Data Set Catalog. The inventory information in these DSCs is current as of July 1, 2004. This inventory information is now no longer maintained in the DSCs, but is now managed in the inventory part of the NSSDC information system. The information existing in the DSCs is now not needed for locating the data files, but we did not remove that inventory information.

The offline tape datasets have now been migrated from the original magnetic tape to Archival Information Packages (AIP's).

A prior restoration may have been done on data sets, if a requestor of this data set has questions; they should send an inquiry to the request office to see if additional information exists.

2. ERRATA/CHANGE LOG:

NOTE: Changes are made in a text box, and will show up that way when displayed on screen with a PDF reader.

When printing, special settings may be required to make the text box appear on the printed output.

A. INPUT

The save tape (DPTRAJ) will be written on a 7-track tape at 800 bpi and in the binary mode by the UNIVAC 1108 computer at JPL. The format and word* assignment are given in Figure 5-1.

At the beginning of the tape, there are two physical records containing BCD information. The trajectory data follows these two records. Each logical save record consists of four physical records. Appropriate flags are provided to signal the beginning and the end of the trajectory data. The format of each physical record has the following characteristics:

1. Record #1

This record consists of 252 words and contains the six-letter BCD mnemonics of all trajectory variables available.

2. Record #2

This is a dummy record consisting of 140 words.

3. Record #3

Physical records #3 through #6 are grouped together as one logical save record. These four records are repeated for each time point requested by the user in his input. There are 28 words in Record #3. The initial logical save record is signaled by the presence of the number 3777777777₈ in Word 3. Thereafter, for each logical save record following the initial one, Word 3 of physical Record #3 will contain zeros. Following the last logical save record, physical Record #3 is repeated several times with the end of data signaled by the presence again of 3777777777₈ in Word 3 of one of them. The end of data is not terminated by an end-of-file.

4. Record #4

This record consists of 252 words. It contains the actual values of the trajectory variables. With the exception of Words 7 and 8, all variables are double precision quantities represented by two consecutive words comprising the UNIVAC 1108 double precision representation.

* Word refers to the UNIVAC 1108 36-bit computer word (six BCD characters).

PAR: ignore

Example: Words 23 and 24 both contain the number 12.

This designates the location of the first half and the second half of the double precision value for Variable #13, inertial azimuth angle (INAZIM).

Words 7 and 8 are two integers containing the value of Variable #3, the Gregorian calendar date. The format is an octal representation of the decimal values described below:

(Word 7) 00YYYYMMDDDD

(Word 8) 00HHNNSSPPPP

where: YYYY - Year

MM - Month

DDDD - Day

HH - Hour

NN - Minute

SS - Second

PPPP - Parts of a second

Example: March 3, 1972, at 02 hours 03 minutes and 59.9999 seconds:

(Word 7) 016542545063₈ = 001972030003₁₀

(Word 8) 001410530177₈ = 000203599999₁₀

5. Record #5 and Record #6

These records consist of 252 words each. Record #5 contains an additional set of parameters that are referred to as "programmable variables" and represents an option capability in the DPTRAJ Program. Record #6 is a dummy record and contains 252 words.

Two important facts should be realized:

- (a) BCD conversion codes for the UNIVAC 1108 are different from the BCD codes of the IBM machine.
- (b) Double precision numbers in FORTRAN V are represented to the base 2000₈.

PAR: ignore

B. OUTPUT

The generalized form of the trajectory save tape is shown in Figure 5-2. The tape will be made up of the following three files of information:

- (1) Header File - The Header File contains logistics type information and serves to identify the trajectory save tape as to content, date of generation, etc. Figure 5-3 references the specific requirements of each experimenter.
- (2) Compendium File - This file contains a listing of all of the requested parameters on the trajectory save tape. It contains the acronym for the parameter and the calling sequence order. Figure 5-3 references the specific requirements of each experimenter.
- (3) Trajectory Data File - This file contains the specific value of each parameter that each user has selected for use with his EDR data. Figure 5-3 references the specific requirements of each experimenter.

C. USER INPUT/OUTPUT

1. TRJPI Start Up Card Format

The TRJPI Start Up Card will have the format shown in Figure 5-8.

2. Teletype-Line Printer Messages

The Teletype-line printer messages are shown in Figures 5-9 through 5-28.

PIONEER PROGRAM

SPECIFICATION PC-262.04

Pioneer F/G Trajectory Data User Requirements

December 20, 1971

1. SCOPE

Specification PC-262.04 describes the detailed requirements for processing the Navigation Team-prepared Trajectory Data "Save" Tape at Ames Research Center on the XDS Sigma 5 computer.

2. APPLICABLE DOCUMENTS

2.1 NASA/ARC SPECIFICATIONS

PC-262.00, Pioneer F/G: Off-Line Data Processing System at ARC

PC-262.01, Pioneer F/G: Off-Line Data Processing System Detailed Processing Requirements.

PC-262.02, Pioneer F/G: Input and Output Tape Requirements

PC-262.03, Pioneer F/G: Data User Requirements

PC-261.00, Pioneer F/G: On-Line Ground Data System Software Specification - General

3. GENERAL PROCESSING REQUIREMENTS

One of the sources of the users trajectory data will be the output of the JPL DPTRAJ "save" tape as defined in PC-262.01, Pioneer F/G: Input and Output Tape Requirements. This tape in addition to being the source for each user's trajectory requirements, shall also provide a capability to calculate the "round-trip-light-time" (RTLTL) required in each user's EDR. A description of the parameters is given in section 3.1 of this specification.

A second source of trajectory information for each user is the output of the JPL Planetary Orbital Geometry and Science Instruments Scan Program (POGASIS). The input tape description is given in PC-262.02, Pioneer F/G: Input and Output Tape Requirements. The output format and parameter description will be supplied at a later date.

3.2 OUTPUT TRAJECTORY DATA USER REQUIREMENTS

The generalized form of the trajectory "save" tape is shown in Figure 3.2. The tape shall be made up of three files of information as described below.

- 3.2.1 Header File. The Header File shall contain logistics type of information and shall serve to identify the trajectory "save" tape as to content, date of generation, etc. Figure 3.2, sheet 2 references the specific requirements of each experimenter.
- 3.2.2 Compendium File. This file shall contain a listing of all the requested parameters on the trajectory "save" tape. It shall contain the acronym for the parameter and the calling sequence order. Figure 3.2 sheet 2 references the specific requirements of each experimenter.
- 3.2.3 Trajectory Data File. This file shall contain the specific value of each parameter that each user has selected for use with his EDR data. Figure 3.2 sheet 2 references the specific requirements of each experimenter.

3.3 DOCUMENT CONTROL

This specification shall be subject to rigid document control by NASA/ARC. In the event changes are required to this specification, replacement, or additional pages will be furnished by NASA/ARC. Replacement or additional pages will be appropriately labeled to indicate change and dates of changes.

4. PRODUCT ASSURANCE PROVISIONS

Not applicable.

5. HANDLING, SHIPPING, AND STORAGE

Not applicable.
